Customer Reviews

The Design for Environment was the best book I got for Christmas. I am very pleased to learn from it that much more is being done to by industry to reduce impacts on the environment and achieve more sustainable development. The book very clearly explains the complexity of modern production systems, how they have been motivated to take more account of the environment, and how they have been able to shift their production. It introduces the life-cycle analysis of production, consumption, and waste and explains the advances that have been made to improve production efficiency and waste management. The book describes how numerous companies in many sectors have shifted techniques to significantly reduce energy consumption (with lower GHG emissions), reduce the use of other natural resources, reduce the waste produced and recycle more of what was previously disposed of in their production processes. While some of these transitions had initial investment costs, in nearly all the cases, the companies saved money and increased their earnings

quite soon. This demonstrates how designing for the environment has proven to be not only good for the environment, but also for the private sector's profits. While I am a little surprised that companies did not figure out earlier how they could have saved this money, it is very encouraging that they are now doing so and providing incentives for more companies to do so. The book provides very strong verification that the normal private sector incentives can lead to much more sustainable development. And some of them can be reinforced by proper government policies to encourage such production and consumption shifts.
